"Throwing the Voice"

Art in Ventriloquism
 A popular fallacy among boys and girls is that certain gifted persons can "throw their voices," that is, can speak in their throats or chests and make the sound of their voices appear to be coming from another source. Such a thing is impossible.

Ventriloquism is an art; it is not magic. Almost anyone can become a ventriloquist by patient practice. The ventriloquist you see on the stage does not "throw his voice"; he merely talks without flexing his lip or face muscles, and as the dummy's mouth moves simultaneously, it seems to the audience that the voice is "thrown" into the dummy.

A very expert ventriloquist, however, can make it appear that his voice is coming from some distant point, though not from any specific point. He muffles the voice so that it sounds far away. By directing attention to a certain object, then muffling the voice, an illusion can be created that the voice came from the indicated point.

If you want to practice ventriloquism, stand before a mirror and try to say words and sentences without moving a muscle of your face. The lips should be slightly parted. You'll find you can say most words pretty easily, with a little practice, but words beginning with or containing b, f, m, p, or v are hard to pronounce without closing the lips for a second. Even these letters though can be made to be understood by throat intonations.—Washington Star.

Water Mills Disappear;

Now Relics of the Past

Throughout Europe, as well as America, the multitude of quaint little grist mills which are run by water are fast becoming relics of the past, writes a correspondent in the Pathfinder Magazine. In Jugoslavia it has been the custom to perch a mill or even a series of such mills in the middle of a small stream.

This reduces the cost of the plant, as the mills are exceedingly simple. They consist of little more than a big box, set up on stilts right over the water. The flour is of the genuine "whole wheat" type, as it is not even sifted.

Such mills, though very picturesque, are not efficient, as they produce such a small amount of flour. They are being discontinued in localities where other and more modern power can be had. Electric current has been introduced very widely where there is water power, and of course gasoline motors are used to a large extent.

Tusks of Mammoths

Because of their finer texture and distinctive "old ivory" pallor the well preserved tusks of the ancient hairy mammoth are more valuable than elephant ivory. Eskimo hunters and white gold miners in Alaska have reaped a valuable harvest from the tusks of the prehistoric mammoths that have never recovered along the perpetually frozen ground of the Arctic coast. Such tusks have proven even a greater source of profit to prospectors in Siberia, from which region it is estimated that the tusks of approximately 20,000 mammoths have reached the world's ivory markets since Siberia has been under the control of the Russians.

Color of Baby's Eyes

It is not only possible, but says Path Finder Magazine, is it quite common occurrence for a child to have brown eyes if the eyes of both parents were blue. This would not be likely to occur if the different strains of the human race had been kept isolated for centuries, but every person of European descent is almost sure to have had both brown-eyed and blue-eyed ancestors. Blue eyes might run in the families of both parents for several generations, only to have the brown-eyed trait show itself after the brown-eyed ancestor had been forgotten. All babies are born with blue eyes, but many of them soon change to other shades.

Lanterns of the Dead

Or "Lanterns of the Dead," as they are called, sounds quite mysterious. About half way on the road from Angers to Poitiers, in France, there is the old town of Fontevault, famous for an ancient abbey where English kings have wished they could be buried and for a fine example of those "lanterns." The purpose of these tall stone lanterns, built like inland lighthouses, was not known until a few years ago, when it was referred to in the writings of Peter, the Venerable, a Twelfth century abbot of Cluny, that they were lit in homage to the dead Christians. Most of them date from the Eleventh century.

Guiding Blind Ships

More than half a million ships are guided up and down the Thames every year by the pilots attached to the great Port of London, says the Montreal Herald. Pilots are in charge on board vessels to steer them through dangerous reaches and channels, or to take ships in and out of harbor, and while on board they take command. Occasionally a pilot is compelled to take long voyages because the weather makes it impossible for him to board the pilot boat. Some time ago a pilot taking the Heron out of Queenstown had to go to New York because he was unable to leave the ship in heavy weather.

HOW TREES DRAW THE MOISTURE TO THE TOPMOST LEAVES.

It is a long journey from the roots of a forest tree to its topmost, outermost leaves.

And for years, observes a writer in the Boston Herald, scientists were baffled by the mystery of how water was pumped or pulled up the long stretch of the tree, and they ventured all sorts of explanations.

The roots pump it, said some. And the leaves pull it, said others. And still different explanations were made by still others. But none of these things could account for the long uphill journey of the water, and even all of them together did not explain. The scientists agree that they've found a more convincing explanation, but they can't be absolutely sure that they are right.

Still, this is the modern idea of the thing:

Drops of water in a narrow stream stick closely together, and if the little stream is narrow enough it must be inside the trunk and branches of a tree the stream can be pulled along like a wire, not breaking, because each little particle of water clings to its neighbor for dear life, rather than give way and be separated.

Scientists believe that the waxy thread of water is pulled upward within the tree by the evaporation which is using up the water at the top of the column. The moisture in the leaves is perpetually evaporating into the air, and consequently the leaves constantly pull upward on the waxy thread of water within the trunk and branches. The thread stream is tough and tough, though the evaporation from the leaves pulls it steadily upward. It doesn't break.

How and When the Term Horse Power Originated

The term "horse power" was originated by James Watt and Matthew Boulton, the British mechanics who improved the steam engine, took it out of the chemical laboratory and put it to practical use. Watt's first work with the steam engine was done in 1763 and his partnership with Boulton was from 1774 to 1780.

As soon as they placed their engine on the market they gave a name for some means of judging and comparing its strength. The horse became their comparison, though the term horse power had its precise meaning at first. But the inventors made practical tests and found that the average London dray horse could work steadily for eight hours at the rate of 33,000 pounds a hour.

Later experiments, set results differing considerably from that of Watt and Boulton, and 22000 feet pounds per minute is more nearly the average to be expected of the horse, but 33,000 pounds has been adopted as the unit and has become a universal standard.

How "O. K." Got Started

There is a fanciful story explaining the first use of "O. K." in the language of Andrew Jackson, who published his papers with these letters under the impression that it was the abbreviation of "All correct," which, according to the story, always spelled "O. K. correct." Later the same story was told of John Jacob Astor, William Henry Harrison and others. But the origin of this mark of approval is not definitely known. Webster's New International Dictionary ascribes it to the corruption of a Choctaw Indian word, "ohkay," which is said to mean "yes" or "in no other way." President Wilson approved this theory and used "ohkay" in approving state papers.

How Coral Reefs Vary

Of the three types of coral reefs, fringing reefs, which are connected with the shores upon which they are built, vary from one-fourth to one-half mile in width and an indeterminate length. Barrier reefs may be of extreme length and of varying distances from the coast. For example, the great barrier reef of northeastern Australia is over 400 nautical miles in length, and the lagoon which separates it from the coast varies in width from 20 to 70 miles. The third type of coral reefs, atolls, or coral islands, may be anywhere from less than a mile to 40 miles in diameter.

How Mercury Is Cleared

The bureau of standards says that a simple way to remove dirt from mercury is to shake the mercury vigorously with some cane sugar, after which the metal is filtered off through a pin hole in the bottom of a paper cone. The whole operation may be repeated if necessary. Instead of filtering through a pinhole the mercury may be squeezed through several thicknesses of cloth.

How Lenin Was Embalmed

Probably no one outside of Russia really knows how the body of Lenin was actually embalmed. It is believed that the body was embalmed with Russian turpentine in which 10 per cent of chlorophenylphenol had been dissolved. Since orthophenylphenol is 45 times as powerful as pure carbolic acid, it would doubtless be effective in producing the sterilization.

How Cigarette Got Name

The word is French, being the diminutive of cigare, the latter is derived from the Spanish, Portuguese and Italian cigarras, which was originally the name of a kind of tobacco grown in Cuba.

STATE OF NEW YORK, SUPREME COURT, County of Oswego—New York Joint Stock Land Bank of Roch-ester, plaintiff, against Joseph M. King, Martha King, his wife, defendants.

In pursuance of a judgment of foreclosure and sale duly granted in No. above entitled action and entered in Oswego county clerk's office on the 29th day of February, 1934, I, Harry V. Clements, the undersigned referee in said judgment, named, will sell at public auction at the front steps of the court house in the city of Oswego, county of Oswego, N. Y., on the 27th day of March, 1934, at 3:30 o'clock p. m., the premises described in said judgment, as follows:

All that tract or parcel of land, situated in the town of Granby, county of Oswego and state of New York, known and distinguished as fifty acres of land to be taken off from the north side of subdivision number four (4) of lot number seventy-two (72) of the original township of Hannibal, now Granby, according to Peter Schenck's made from his survey and dated September 28, 1829, and bounded as follows: on the north by the state road running east and west through said lot, on the east and west by the east and west lines of said subdivision of said lot. The south line of said fifty (50) acres to be parallel to and far enough from the north line thereof to include fifty (50) acres of land, more or less.

Also a certain other piece or parcel of land, situated in the town of Granby, county of Oswego and state of New York, and being part of lot seventy-two (72) of the original township of Hannibal, now Granby, and is bounded and described as follows: On the north by the south line of a parcel of fifty (50) acres conveyed to Henry Nicholson in March, 1878; on the east by lands lately belonging to Philander Pierce; on the south by the highway; on the west by lands of Samuel Graza, containing twenty-seven and seven-eighths hundredths (27.77) acres of land, be the same more or less.

Dated at the city of Auburn, N. Y., this 13th day of February, 1934.

Harry V. Clements, Referee.

Rouley C. Mertz, plaintiff's attorney, office and P. O. address, 311 Alexander St., Rochester, N. Y., 2-15-7.
