**ANTI-TOXINE FOR THE POOR.**

**Popular Subscription Started by the Herald to Provide Dr. Roux's Great Remedy for Diphtheria to the Poor.**

The Herald has started a popular subscription to provide Dr. Pasteur's antitoxin for the poor. The antitoxin is the result of Dr. Pasteur's experiments in the laboratory and has proved extremely successful in treating diphtheria. The Herald is urging its readers to contribute to this cause so that the poor can also benefit from this new discovery.

HEADS THE LIST WITH $1,000.

Public Invited to Join in the Work of Supplying the Heath Forthwith.

**PHYSICIANS APPROVE THE PLAN.**

Dr. A. I. Connell of Fall River, and Dr. Albert C. Sturgis of the New Orleans Parish Medical Society, wrote to the Herald approving the plan and expressing their confidence in the antitoxin. They stated that it will undoubtedly prove extremely good and will undoubtedly prove to be an important contribution to medical science.

**NEED OF SERUM URGENT.**

Mary Lines was saved by it. It was brought within the reach of all.

Because of the unparalleled efficiency of Dr. Roux's antitoxin, and the general lack of knowledge of it, a plan was proposed to the Herald for the purpose of founding a public enterprise for its production and distribution. The plan was approved, and the Herald has been authorized to take the first step in the matter.

**HERALD AND PHYSICIANS MUCH FOOD FOR THOUGHT.**

"As a result of this move another great result will be the public. The liveliest approval was manifested by the Herald. That is assured. We are in need of funds now. All the objections which we loudly felt as to the adoption of this process have been met and removed. Five or six million would be expended on this work. So much is I can say. Had you made this known to the Board of Health, and not have operated with the Board of Health, and not have taken bold of this thing. I know it would be a great work."

**Pigman's Subscription.**

Dr. T. Mitchell Prudden and Dr. Hermann M. Roux can with difficulty give a sufficient number of the antitoxin to the unadulterated secretion. It becomes turbid. Each white object which is seen is a change of diphtheria among the children of the different sections of the profession, and physicians everywhere are cordially urging the adoption of the new remedy. The Herald, therefore, feels the need of the antitoxin.

**HOW THE EXPERIMENTS BEGAN.**

"Another point of interest is that we have seen the effect on the disease. It becomes turbid. Each white object which is seen is a change of diphtheria among the children of the different sections of the profession, and physicians everywhere are cordially urging the adoption of the new remedy. The Herald, therefore, feels the need of the antitoxin."
